

Mr. COLONESE, ALL CLASSES

SCIENCE in the World

Part of being a science student is paying attention to current events and science in the world around us. Your task over the school shut down is to read or watch science-related news. If you watch the **news**, you may choose to watch a morning, afternoon, evening, or night time TV broadcast, or an online airing of a news program. Most news shows *include weather, health, medicine, technology* and of course, *Coronavirus!* You may also watch **science-related videos** from any websites that you find interesting. For **each** news segment, article or video you watch, **please respond to the prompts below on a separate paper.**

1. State the name and date of the program, channel, website or story
2. Give a one-sentence description/summary of what you read or watched
3. What were your overall reactions to this new story, article or video? Did any information in the news story/article/video help you understand something better, or cause you to think in a new way? Explain.

Example-

1. March 10, 2020 morning news on NBC Connecticut (viewed online)
2. Second person in CT tested positive and many changes are happening (colleges are shutting, nursing homes are limiting visitors);
3. Coronavirus story- People are very concerned about the Coronavirus- they need to know if events aren't happening and what to do. I'm not convinced that closing the Capitol to clean it will really make a difference if someone sick comes in when it reopens. This story made me think that this is more serious than I thought!
